

IN THE CLAIMS:

Please amend the claims to read as follows.

Claim 1 (Currently Amended): An information converting method of converting audio information, which comprises a plurality of partial-audio information based on a predetermined record standard in each of which output control information to control a state of the audio information at a time of outputting the audio information to an external portion is included, into transmission information to be transmitted through a data bus based on a predetermined transmission standard, said method comprising:

an extracting process of extracting the output control information from each of the partial-audio information;

a dividing process of dividing the audio information for ~~each~~ a predetermined ~~information~~ amount, which is set in advance so as to transmit the transmission information through the data bus, to thereby generate divided-audio information;

a generating process of adding the extracted output control information onto the generated divided-audio information to thereby generate an information unit for transmitting the audio information through said data bus; and

an outputting process of generating the transmission information by using a plurality of the generated information units and outputting the generated transmission information onto said data bus.

Claim 2 (Currently amended): An information converting method according to

Claim 1, wherein

the output control information comprises:

first output control information to be transmitted through said data bus, in response to the number of samplings preset in the audio information; and

second output control information to be transmitted through said data bus only if it is required, and

if a transmission of the second output control information is not required, said generating process generates the information unit comprising the divided-audio information, the first output control information and predetermined other information in place of the second output control information.

Claim 3 (Currently amended): An information converting method according to Claim 2, wherein

the first output control information comprises mix control information to perform a channel mix process of the audio information at the time of outputting, and

the second output control information comprises frequency identification information indicative of a sampling frequency of the audio information.

Claim 4 (Currently amended): An information converting method according to Claim 2, wherein

said generating process adds first identification information indicative of a content of the first output control information at a position to be transmitted prior to the first output control information within each of the information unit, and

said generating process adds second identification information indicative of a content of the second output control information at a position to be transmitted prior to the second output control information within each of the information unit.

Claim 5 (Original): An information converting method according to Claim 1, wherein

the predetermined transmission standard is an IEEE (Institute of Electrical and Electronic Engineers) 1394 standard,

said data bus comprises a serial data bus through which the transmission information is transmitted in accordance with the IEEE 1394 standard, and

said information unit comprises one portion of an isochronous packet based on the IEEE 1394 standard.

Claim 6 (Original): An information converting method according to Claim 1, wherein the predetermined record standard is a DVD audio standard, the partial-audio information comprises an audio pack based on the DVD audio standard, and

the output control information comprises information in a private header based on the DVD audio standard.

Claim 7 (Currently amended): An information converting apparatus for converting audio information, which comprises a plurality of partial-audio information based on a predetermined record standard in each of which output control information to control a

state of the audio information at a time of outputting the audio information to an external portion is included, into transmission information to be transmitted through a data bus based on a predetermined transmission standard, said apparatus comprising:

an extracting device for extracting the output control information from each of the partial-audio information;

a dividing device for dividing the audio information for each a predetermined ~~information~~ amount, which is set in advance so as to transmit the transmission information through the data bus, to thereby generate divided-audio information;

a generating device for adding the extracted output control information onto the generated divided-audio information to thereby generate an information unit for transmitting the audio information through said data bus; and

an outputting device for generating the transmission information by using a plurality of the generated information units and outputting the generated transmission information onto said data bus.

Claim 8 (Currently amended): An information converting apparatus according to Claim 7, wherein

the output control information comprises:

first output control information to be transmitted through said data bus, in response to the number of samplings preset in the audio information; and

second output control information to be transmitted through said data bus only if it is required, and

if a transmission of the second output control information is not required, said

generating device generates the information unit comprising the divided-audio information, the first output control information and predetermined other information in place of the second output control information.

Claim 9 (Currently amended): An information converting apparatus according to Claim 8, wherein

the first output control information comprises mix control information to perform a channel mix process of the audio information at the time of outputting, and

the second output control information comprises frequency identification information indicative of a sampling frequency of the audio information.

Claim 10 (Currently amended): An information converting apparatus according to Claim 8, wherein

said generating device adds first identification information indicative of a content of the first output control information at a position to be transmitted prior to the first output control information within each of the information unit, and

said generating device adds second identification information indicative of a content of the second output control information at a position to be transmitted prior to the second output control information within each of the information unit.

Claim 11 (Original): An information converting apparatus according to Claim 7,
wherein

the predetermined transmission standard is an IEEE (Institute of Electrical and
Electronic Engineers) 1394 standard,

said data bus comprises a serial data bus through which the transmission
information is transmitted in accordance with the IEEE 1394 standard, and

said information unit comprises one portion of an isochronous packet based on the
IEEE 1394 standard.

Claim 12 (Original): An information converting apparatus according to Claim 7,
wherein

the predetermined record standard is a DVD audio standard,

the partial-audio information comprises an audio pack based on the DVD audio
standard, and

the output control information comprises information in a private header based on
the DVD audio standard.

Claim 13 (Currently amended): An information reproducing apparatus comprising:

(i) an information converting apparatus for converting audio information,
which comprises a plurality of partial-audio information based on a predetermined record
standard in each of which output control information to control a state of the audio
information at a time of outputting the audio information to an external portion is

included, into transmission information to be transmitted through a data bus based on a predetermined transmission standard, said information converting apparatus comprising:

an extracting device for extracting the output control information from each of the partial-audio information;

a dividing device for dividing the audio information for ~~each~~ a predetermined information amount, which is set in advance so as to transmit the transmission information through the data bus, to thereby generate divided-audio information;

a generating device for adding the extracted output control information onto the generated divided-audio information to thereby generate an information unit for transmitting the audio information through said data bus; and

an outputting device for generating the transmission information by using a plurality of the generated information units and outputting the generated transmission information onto said data bus, and

(ii) a reproducing device for reproducing the audio information.
